Appl. No. 10/516.866 Amdt. Dated January 18, 2008 Reply to Office action of November 19, 2007 Attorney Docket No. P17157-US1 EUS/J/P/08-3021

## Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

## Listing of Claims:

1. (Currently Amended) Method for operating a switching node of a communications network comprising the steps of

receiving a communication service request.

processing the requested communications service,

determining an operation mode of the switching node by-identifying a protocol associated with the communications service request, wherein the determined operation mode indicates whether the switching node is operative for the processing of the requested communication service part of a layered architectural environment providing a user plane layer for user data and a control plane layer for signaling data, or part of a non-layered architectural environment not providing a split between a user plane and a control plane, and wherein the processing of the requested communications service comprises the operating of the switching node in the determined operation mode.

- (Previously Presented) Method according to claim 1, wherein the communications service request is a call set-up request.
- (Previously Presented) Method according to claim 1, wherein the operation
  mode is determined according to at least one predetermined rule, which is set-up
  according to available network capabilities.
- 4. (Previously Presented) Method according to claim 1, wherein a plurality of incoming routes from an access network to the switching node are provided, at least one predetermined rule comprises an assignment of a dedicated incoming route to an operation mode of the switching node, and wherein the step of determining the

Appl. No. 10/516.866 Amdt. Dated January 18, 2008 Reply to Office action of November 19, 2007 Attorney Docket No. P17157-US1

EUS/J/P/08-3021

operation mode comprises a determination of an incoming route of the communication

service request and a comparison of the determined incoming route against at least one

predetermined rule.

(Previously Presented) Method according to claim 1, wherein at least one

predetermined rule comprises an assignment of a dedicated access technology to an

operation mode, said dedicated access technology provided by an access network for serving a subscriber terminal of a communication system comprising the switching

node, and wherein the step of determining the operation mode comprises the

determination of the access technology used by the subscriber terminal and a

comparison of the determined access technology against at least one predetermined

rule.

(Previously Presented) Method according to claim 1 wherein

communication service request comprises an identifier of a communications service

terminating party, at least one predetermined rule comprises an assignment of the identifier to a dedicated operation mode, and wherein the step of determining the

operation mode comprises a determination of the identifier and a comparison of the

determined identifier against at least one predetermined rule.

(Previously Presented) Method according to claim 1, wherein at least one predetermined rule indicates by means of a statistical distribution factor a distribution.

for how many received communications service requests the switching node shall

operate as a switching node of the layered architectural environment or as a switching

node of the non-layered architectural environment, and wherein the determined

operation mode depends on the statistical distribution factor.

(Previously Presented) Method according to claim 1, wherein

determination of the operation mode comprises a determination of a current load level

of the switching node in at least one operation mode, and wherein the determined

Appl. No. 10/516,866 Amdt. Dated January 18, 2008 Reply to Office action of November 19, 2007 Attorney Docket No. P17157-US1 EUS/J/P/08-3021

operation mode for the processing of the requested communications service depends on the determined load level.

- 9. (Previously Presented) Method according to claim 1, wherein the communication service request requests a subscriber terminal terminating communications service, wherein at least one predetermined rule comprises an assignment of an access technology available to the subscriber terminal to a dedicated operation mode, and wherein the step of determining the operation mode comprises the determination of the access technology available to the terminating subscriber terminal, and the determined operation mode depends on the determined access technology.
- 10. (Previously Presented) Method according to claim 1, wherein the switching node processes the requested communications service as a MSC/VLR, if the determined operation mode indicates that the switching node is part of the non-layered architectural environment.
- 11. (Previously Presented) Method according to claim 1, wherein the switching node processes the requested communications service as a MSC-Server, if the determined operation mode indicates that the switching node is part of the layered architectural environment.
- 12. (Previously Presented) Method according to claim 1, wherein the determination of the operation mode comprises a determination of at least one of a group of an origin of the communications service request and a destination of the communications service request, and wherein the determined operation mode depends on the at least one determined member of the group.
- 13. (Previously Presented) Method according to claim 1, wherein the switching node is determined operatively to process the requested communication service as part of the non-layered architectural environment, if an origin of the communications service

Appl. No. 10/516,866 Amdt. Dated January 18, 2008 Reply to Office action of November 19, 2007 Attorney Docket No. P17157-US1

EUS/J/P/08-3021

request, in particular an originating radio network node, is local to the switching node,

and a destination indicated by the communications service request is local to the

switching node.

14. (Previously Presented) Method according to claim 1, wherein the switching node is determined operatively to process the requested communication service as part

of the layered architectural environment, if an origin of the communications service

request, in particular an originating radio network node, is remote to the switching node,

and a destination indicated by the communications service request is remote to the

switching node.

15. (Previously Presented) Method according to claim 14, wherein the switching

node applies local switching, if an origin of the communications service request, in

particular an originating radio network node, is local to the destination indicated by the

communications service request.

16. (Previously Presented) Method according to claim 1, wherein the switching

node is determined operatively to process the requested communication service as part of the layered architectural environment, if an origin of the communications service

request, in particular an originating radio network node, is remote to the switching node,

and a destination indicated by the communications service request is local to the

switching node.

17. (Previously Presented) Method according to claim 1, wherein the switching

node is determined operatively to process the requested communication service as part

of the layered architectural environment, if an origin of the communications service request, in particular an originating radio network node, is local to the switching node.

and a destination indicated by the communications service request is remote to the

switching node.

18. (Canceled)

19. (Currently Amended) Network node, in particular a combined MSC/VLR and MSC-Server, comprising

an access network interface for the user plane.

an access network interface for the control plane.

a core network interface for the user plane,

a core network interface for the control plane.

a media gateway interface.

a media gateway operation unit connected to the user plane interfaces adapted to provide media gateway functions.

a MSC-Server operation unit connected to the control plane interfaces and to the media gateway interface, the MSC-Server operation unit adapted to provide MSC-server functionality,

a selection unit adapted to determine for a communication service request received via any control plane interface according to at least one predetermined rule an operation mode for a processing of the requested communication service by identifying the protocol associated with the communications service request, wherein the determined operation mode indicates whether the network node is operatively for the processing of the requested communication service part of a layered architectural environment providing a user plane layer for user data and a control plane layer for signaling data, or operatively part of a non-layered architectural environment not providing a split between a user plane and a control plane and a processor connected to the interfaces and units of the switching node, said processor being adapted to process a requested communications service in accordance with a determined operation mode of the network node.

20. (Previously Presented) Network node according to claim 19, comprising means for storing, in particular a lookup table, network node identifiers and related

Appl. No. 10/516,866 Amdt. Dated January 18, 2008 Reply to Office action of November 19, 2007 Attorney Docket No. P17157-US1 EUS/J/P/08-3021

indications, indicating whether the identified network nodes are local or remote to the network node.
